Class 06: R Functions

Nicolò (PID: A18109144)

All about functions in R

Functions are the way we get stuff done in R. We call a function to read data, compute stuff, plot stuff, etc. etc.

R makes writing functions accessible but we should always start by trying to get a working snippet of code first before we write our function.

Today's lab

We will grade a whole class of student assignments. We will always try to start with a simplified version of the problem.

```
# Example input vectors to start with student1 <- c(100, 100, 100, 100, 100, 100, 100, 90) student2 <- c(100, NA, 90, 90, 90, 90, 97, 80) student3 <- c(90, NA, NA, NA, NA, NA, NA, NA)

mean(student1)
```

[1] 98.75

Let's be nice instructors and drop the lowest score so the answer here should be 100

```
min(student1)
```

[1] 90

I found the which.min() function that may be useful here. How does it work? Let's just try it:

```
student1
[1] 100 100 100 100 100 100 100 90
  which.min(student1)
[1] 8
I can use the minus syntax trick to get everything but the element with the min value
  student1[-which.min(student1)]
[1] 100 100 100 100 100 100 100
I have my first working snippet of code
  mean(student1[-which.min(student1)])
[1] 100
Let's test on the other students
  mean(student2[-which.min(student2)])
[1] NA
  mean(student3[-which.min(student3)])
[1] NA
Where is the problem? It's the NA value, let's ignore it
  mean(student2, na.rm=TRUE)
[1] 91
```

No bueno. We need to fix this!

I want to stop working with student1, student2 etc. and typing it out every time so let's instead work wirh an input called x.

```
x <- student2
x
[1] 100 NA 90 90 90 90 97 80
```

We want to overwrite the NA values with zero - if you miss a homework you score zero on this homework.

Google and Claude told me about the is.na() function, let's use it.

```
is.na(x)
```

[1] FALSE TRUE FALSE FALSE FALSE FALSE FALSE

We can use logicals to index a vector

```
x[is.na(x)] <- 0
x
[1] 100 0 90 90 90 90 97 80
mean(x[-which.min(x)])
```

[1] 91

This is my working snipped of code that solves the problem for all my example student inputs

```
x <- student2
#Mask NA values to 0
x[is.na(x)] <- 0
#Drop lowest score and get the mean
mean(x[-which.min(x)])</pre>
```

[1] 91

Q1. Write a function grade() to determine an overall grade from a vector of student homework assignment scores dropping the lowest single score. If a student misses a homework (i.e. has an NA value) this can be used as a score to be potentially dropped. Your final function should be adquately explained with code comments and be able to work on an example class gradebook such as this one in CSV format: "https://tinyurl.com/gradeinput" [3pts]

```
grade <- function(x) {</pre>
    #Mask NA values to 0
    x[is.na(x)] \leftarrow 0
    #Drop lowest score and get the mean
    mean(x[-which.min(x)])
  }
Use this function:
  grade(student1)
[1] 100
  grade(student2)
[1] 91
  grade(student3)
[1] 12.85714
We need to read the gradebook
  gradebook <- read.csv("https://tinyurl.com/gradeinput", row.names = 1)</pre>
  gradebook
           hw1 hw2 hw3 hw4 hw5
student-1 100 73 100 88
                             79
student-2
            85 64
                    78 89
                             78
student-3
            83 69
                    77 100
                             77
student-4
            88 NA
                    73 100
                             76
student-5
            88 100
                    75
                        86
                             79
student-6
            89 78 100
                         89
                             77
student-7
            89 100
                    74
                        87 100
student-8
            89 100
                    76
                        86 100
            86 100
student-9
                    77 88 77
                    79
                        NA 76
student-10
            89
                72
student-11 82 66
                    78 84 100
```

```
student-12 100
                70
                    75 92 100
            89 100
                     76 100
student-13
                             80
student-14
            85 100
                     77
                         89
                             76
                     76
student-15
            85
                65
                         89
                             NA
student-16
            92 100
                     74
                         89
                             77
student-17
            88
                63 100
                         86
                             78
student-18
            91
                NA 100
                         87 100
student-19
            91
                68
                     75
                         86
                             79
student-20
           91
                68
                     76
                         88
                             76
```

Calculate the averages for every student in the gradebook:

```
avg_scores <- apply(gradebook, 1, grade)
avg_scores</pre>
```

```
student-1
            student-2
                       student-3 student-4
                                              student-5
                                                         student-6
                                                                     student-7
                                                                         94.00
     91.75
                82.50
                           84.25
                                       84.25
                                                  88.25
                                                             89.00
 student-8
            student-9 student-10 student-11 student-12 student-13 student-14
                87.75
                                                  91.75
     93.75
                           79.00
                                       86.00
                                                             92.25
                                                                         87.75
student-15 student-16 student-17 student-18 student-19 student-20
     78.75
                89.50
                           88.00
                                       94.50
                                                  82.75
                                                             82.75
```

Q2. Using your grade() function and the supplied gradebook, Who is the top scoring student overall in the gradebook? [3pts]

```
which.max(apply(gradebook, 1, grade))
```

student-18 18

Q3. From your analysis of the gradebook, which homework was toughest on students (i.e. obtained the lowest scores overall? [2pts]

```
mask <- gradebook

mask[is.na(mask)] <- 0
hw.ave <- apply(mask, 2, mean)
hw.ave</pre>
```

hw1 hw2 hw3 hw4 hw5 89.00 72.80 80.80 85.15 79.25

```
which.min(hw.ave)
hw2
  2
     Q4. Optional Extension: From your analysis of the gradebook, which homework
     was most predictive of overall score (i.e. highest correlation with average grade
     score)? [1pt]
  highest_cor <- apply(mask, 2, cor, y=avg_scores)</pre>
  highest_cor
      hw1
                 hw2
                            hw3
                                        hw4
                                                   hw5
0.4250204\ 0.1767780\ 0.3042561\ 0.3810884\ 0.6325982
  which.max(highest_cor)
hw5
  5
```
